ABSTRACT:

PROBLEM TO BE SOLVED: To provide an electronic decision requisition system capable of putting an item substitutively approved by a presentative under the management of an approver.

SOLUTION: In the electronic decision requisition system 1, when the substitutive approval of a certain decision requisition item is inputted from a submanager terminal 30 to a sales office server 50, the sales office server 50 stores the decision item as an approver non-confirmed item, and when the case of confirming the substitutively approved decision

n approver.

SOLUTION: In the electronic decision requisition system 1, when the substitutive approval of a certain decision requisition item is inputted from a submanager terminal 30 to a sales office server 50, the sales office server 50 stores the decision item as an approver non-confirmed item, and when the case of confirming the substitutively approved decision requisition item is inputted from a branch manager terminal 40 to the sales office server 50 later, the sales office server 50 excludes the substitutively approved decision requisition item from the approver non-confirmed item. Therefore, even when the submanager substitutively approved the item without being known by the branch manager, knowledge, the branch manager can confirm the item in posteriority, so that the substitutively approved decision requisition item can be put under the management of the branch manager. Thus the decision requisition item can be prevented from being substitutively approved maliciously by the submanager because of needing the post confirmation by the approver.
